

AI for Addressing the Recovery of Nature

Dr. Olga Isupova

Leverhulme Centre for Nature Recovery, University of Oxford

Earth observations

- Forest health monitoring
- Estimating extreme weather damage
- Mapping deforestation

- Crop monitoring and management
- Irrigation requirements
- Field boundary management

- Land use monitoring
- Change detection
- Infrastructure planning

- Mapping disaster damage
- Disaster prediction

- Resource mapping
- Environmental monitoring
- Infrastructure management

- Mapping disaster damage
- Disaster prediction

AI can enable Earth observation more

Planet collects ~10TB satellite imagery per day

Elephant detection from space

Elephant detection from space

Manually labelled elephants

Deep learning model

- Fully-grown bull elephant shows up in less than 15 pixels

Elephant detection from space

Elephant detection from space

Elephant detection from space

Elephant detection from space

Seismic fault detection from space

Seismic fault detection from space

Features

- Landsat-8 channels
- Elevation
- Slope
- Terrain Ruggedness Index

Labels

- USGS Fault data
- Manual selection of representative faults of different types
- Faults are rasterized into 4 pixel (120m) width lines

Example elevation maps / corresponding labels

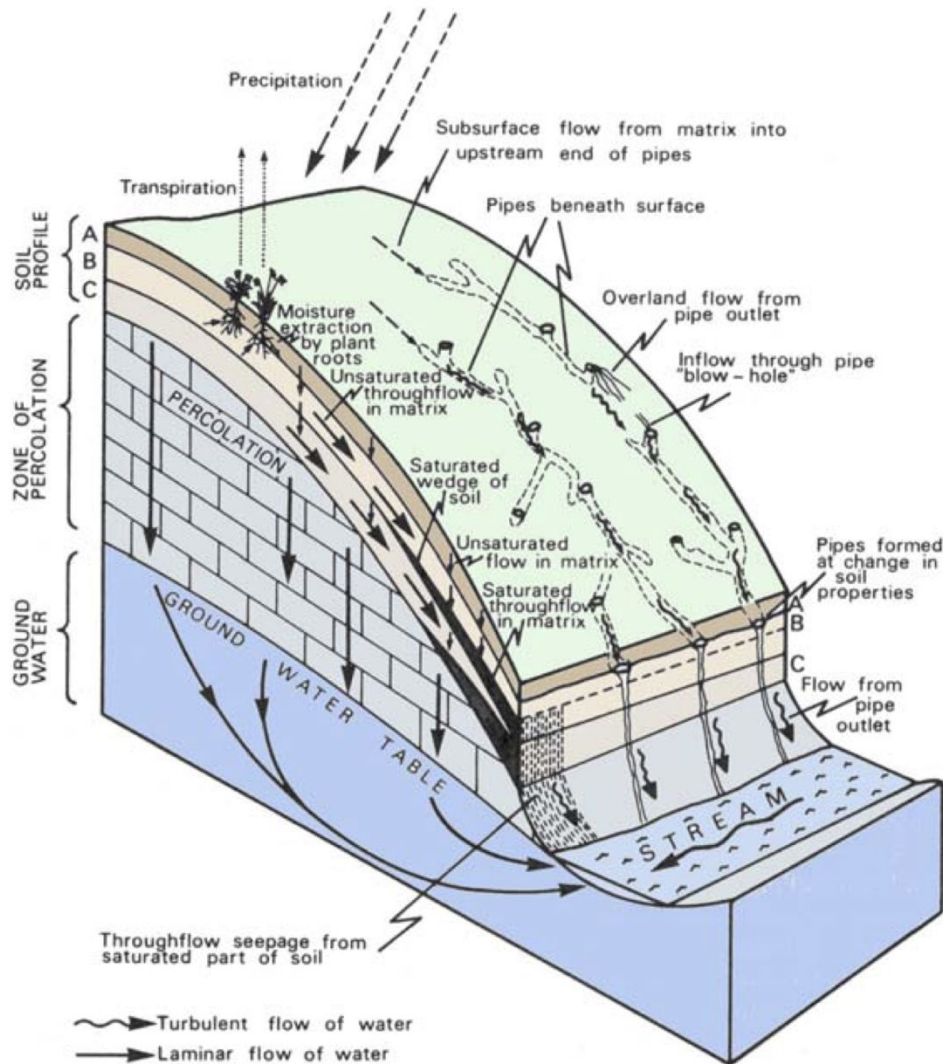

Seismic fault detection from space

Discovering hydrological concepts from space

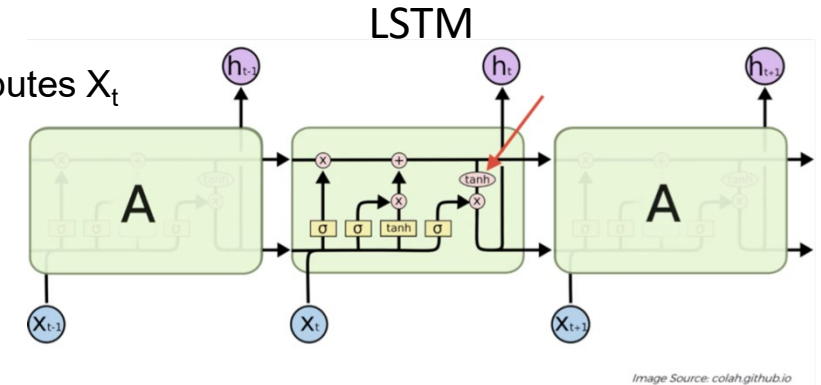

Discovering hydrological concepts from space

Camel—GB

Discharge h_t

Meteorological and catchment attributes X_t

Estimated soil water volume; Target value in grey (ERA5-Land dataset)

Superresolution of satellite imagery

Superresolution of satellite imagery

10 m RGB bands of Sentinel-2 images

4.77 m RGB PlanetScope images

Superresolution of satellite imagery

(a) Low-res (S-2, 10m)

(b) SI Super-res (4.7m)

(c) MI Super-res (4.7m)

(d) High-res (Planet, 4.7m)

Summary

- AI can unlock many more applications for Earth observations that were previously impossible
- Only a few of already existing examples:
 - Satellite imagery as an additional tool for conservation monitoring
 - Global mapping of seismic faults to mitigate earthquake damage
 - Prediction and understanding of hydrological events
 - Superresolution of satellite imagery that in turn enhance performance on downstream tasks
